Description:

A distinctive tree with pendulous branches hanging loosely off a graceful, broad, rounded crown; tends to drop branchlets, and has an aggressive root system, so do not plant near homes; larval host for gypsy moth

Ornamental Features

Weeping Willow is primarily valued in the landscape for its highly ornamental weeping form. It has rich green deciduous foliage. The serrated narrow leaves turn yellow in fall.

Landscape Attributes

Weeping Willow is a dense deciduous tree with a rounded form and gracefully weeping branches. It lends an extremely fine and delicate texture to the landscape composition which can make it a great accent feature on this basis alone.

This is a high maintenance tree that will require regular care and upkeep, and is best pruned in late winter once the threat of extreme cold has passed. Gardeners should be aware of the following characteristic(s) that may warrant special consideration;

- Messy
- Insects
- Disease

Weeping Willow is recommended for the following landscape applications;

- Accent
- Shade

Planting & Growing

Weeping Willow will grow to be about 40 feet tall at maturity, with a spread of 40 feet. It has a low canopy with a typical clearance of 2 feet from the ground, and should not be planted underneath power lines. It grows at a fast rate, and under ideal conditions can be expected to live for 60 years or more.

This tree should only be grown in full sunlight. It is quite adaptable, preferring to grow in average to wet conditions, and will even tolerate some standing water. It may require supplemental watering during periods of drought or extended heat. It is not particular as to soil type or pH. It is highly tolerant of urban pollution and will even thrive in inner city environments. This species is not originally from North America.
